The invention discloses an isolated human polypeptide, and encoding nucleic acid, for a G protein-coupled receptor (GPCR), particularly the nucleic acid, for a G protein-coupled receptor (GPCR), particularly the communication between calls and their environment and are characterised by a serpentine structure that passes through the ceall membrane seven times hence the reason such receptors are sometimes called seven transmembrane receptors (TTM). The polymuclectides and polypeptides are useful for identifying an index and polymuclectides and polypeptides are the polypeptide or in the polypeptide for identifying an index and that binds the polypeptide or polymuclectide and/or modulates its biological activity, for screening at the polymoclectide and/or modulates its biological activity, for screening a compound useful for a genetic prediposition to the disorder, for identifying compounds useful for the treatment of a mental disorder, for identifying compounds useful for the treatment of a mental disorder, for identifying compounds useful for the treatment of a mental disorder, for identifying an immune response in a mammal. The nucleic acid or negul for inducing an immune response in a mammal. The nucleic acid or polypeptide is particularly useful, using gene therapy, for treating e.g. anxiety disorders, depression, bipolar disorder, schizophrenia, huntington's disease, dyskinesias, manic depression, stroke, Parkineson's be used for treating diabetes, inflammation or wounds. The sequences presented in ABS70202-ABS70248, ABS70338 and ABS70243 are the DNAs conding the nGPCRs (also referred to as beGPCRs)

nucleic acids and polypeptides of the nG protein-coupled receptor, ful for treating or diagnosing a mental disorder or a disorder seting the brain, e.g. anxiety disorders, schizophrenia, stroke or

The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 21-18, 40, 41, 53-60) and their codding sequences. The present sequence is the coding sequence for one such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transmembrane receptors and function in signal than the diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for creening a human to diagnose a disorder affecting the brain or a genetic confermitying compounds useful for treating schizophrenia. Detection of nGPCRx in a sample is useful as a diagnostic tool for diseases or constitution of sorders infections such as HIV-I, metabolic and cardiovascular diseases, proliferative disorders, renal failure, rheumatoid arthritis, or nordering such as HIMPADD (attention deficit hyperactivity disorder attention deficit disorder), and neuronal disorders such as Alzheimer's disease, Parkinson's disease, migraine and senile dementia. Alzheimer's disorders include inflammatory conditions (e.g. Crohn's disease), rheumatoid arthritis, autoimmune disorders cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New G protein-coupled receptor (nGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21 IleSerLeuTyrPheIleValLeuIleGlyGlyLeuValGlyValIleSerIleLeuPhe

This invention describes novel polypeptides which have anti-HIV, hepatcherotecine, cytostatic, neuroprotective, antiparkinsonian, hepatchtropic, laxative, cerebroprotective, antiinflammatory, virucide, antibacterial, fungicide and protozoacide activity. The products of the invention are useful for treating a disease or condition associated with decreased expression or over expression of functional G-protein coupled receptors (GCREC), will antibodies generated against the polypeptide of with the expression of GCREC e.g. arterioscelerosis, cirrhosis, cancer, stroke, Alzheimer's disease, Parkinson's disease, Constipation, AIDS, or bacterial, viral, fungal or protozoal infections. The compounds described in the invention can be used for gene therapy. AAPR988807-encode the GCREC proteins represented by AAB71322-AAB71369, described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               402
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    462
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     522

This invention describes novel polypeptides which have anti-HIV, antipateriosclerotic, cytostatic, neuroprotective, antiparkineonian, hepatetropic, laxative, cerebroprotective, antiinflammatory, virucide, antibacterial, fungicide and protozoacide activity. The products of the invention are useful for treating a disease or condition associated with decreased expression or over expression of functional G-protein coupled recepcors (GCREC), while antibodies generated against the polypeptide of the invention are useful for diagnosing a condition or disease associated with the expression of GCREC e.g. arteriosclerosis, cirrhosis, cancer, stroke, Alabaimer's disease, parkinson's disease, Crohn's disease, stroke, Alabaimer's disease, parkinson's disease, Crohn's disease, constipation, ALDS, or bacterial, viral, fungal or protozoal infections. The compounds described in the invention can be used for gene therapy. AAB781359, described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  343 CTCCTGGTGAAAATGAACACCCGGTCAGTGACCACCATGGCGGTCATTAACTTGGTGGTG 402

This invention describes novel polypeptides which have anti-HIV, antiparkinesorleriotic, cytostatic, neuroprotective, antiparkinesonian, hepatotropic, laxative, cerebroprotective, antiparkinesonian, antibacterial, fungicide and protozoacide activity. The products of the invention are useful for treating a disease or condition associated with decreased expression of functional G-protein coupled receptors (GCRC), while antibodies generated against the polypeptide of the invention are useful for diagnosing a condition or disease associated with the expression of GCREC e.g. arteriosclerosis, cirrhosis, cancer, stroke, Alzheimer's disease, Parkinson's disease, Crohn's disease, constitation, ALS, or bacterial, viral, fungal or protozoal infections. The compounds described in the invention can be used for gene therapy.

AAF88580-AAF88627 encode the GCREC proteins represented by AAB71322-

De Moor L;

The invention relates to a G protein-coupled receptor (GPCR) IGS70

Co polypeptide including sequences that are 98-99.6% identical. Also

Included are the polymucleotide encoding IGS70 (including sequences 9999.6% identical to the polymucleotide or the DNA insert contained in

Description of the polymucleotide or the DNA insert contained in

CC 99.6% identical to the polymucleotide or the DNA insert contained in

CC 99.6% identical to the polymucleotide or the DNA insert contained in

CC 000 principleotide a DNA or RNA expression system producing IGS70, a host

CC comprising the expression system, IGS70 receptor membrane preparation

CC 000 describe or the cell, an antibody immunospecific for IGS70, IGS70 is

CC 000 subject related to expression or activity of the IGS70 polypeptide in a

CC 000 subject by determining the presence or absence of mutation in the

CC 000 subject by determining the presence or absence of the subject in a

CC 000 subject the subject IGS70 is also useful identifying agonist

CC 00 antagonist are useful for treating psychiatric and central nervous

CC 00 antagonist are useful for treating psychiatric and central nervous

CC 00 antagonist anxiety, cardiovascular diseases such as heart

CC multiple sclerosis, myocadial infarction, kidney disease uch as

CC multiple spatrointesthal disorders such as irritable bowel

CC renal failure, gastrointesthal disorders such as irritable bowel

CC syndrome (IBS), inflammatory bowel disease, ulcers such as gastric ulcer,

CHIV), diabetes, osteporosis and allergies, The present sequence encodes

CC the human GPCP IGS70 60 AIGCCIGGCCACAATACCICCAGGAAITCCTCTIGCGAICCTATAGIGACACCCCACTIA 1 MetProGlyHisAsnThrSerArgAsnSerSerCysAspProIleValThrProHisLeu 21 IleSerLeuTyrPheileValLeuIleGlyGlyLeuValGlyValIleSerIleLeuPhe Sequence 1051 BP; 244 A; 231 C; 230 G; 346 T; 0 U; 0 Other; Length:

This invention relates to a novel G-protein coupled receptor (GAVE18)

that is involved in signal transduction in respect to inflammation and

the physiological immunological response. Molecules which may modulate

the signalling activity or signal transduction of the receptor may be

antinflammatory, antiasthmatic, antirheumatic or antiarthritic. The

GAVE18 receptor and the DNA sequence encoding it may be a target for

antisense therapy or gene therapy. The nucleic acid molecule, GAVE18

proteins and antibodies may be useful in screening assays, detection

assays (for example chromosomal mapping, tissue typing or forensic

blology), or predictive medicine (for example diagnostic assays,

consostic assays, monitoring cilnical trials and pharmacogenomics. The

prognostic assays, monitoring cilnical trials and pharmacogenomics. The

goonist and antagonist are also useful for preventing and treating a

disease or disorder associated with aberrant expression or activity of

GAVE18, such as inflammation and immunological-related diseases or

checkers, for example asthma, chronic obstructive pulmonary disease or

rheumatoid arthritis. The present sequence is the DNA sequence encoding

the GAVE18 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

The invention provides new G-protein coupled receptor (GPCR) polypeptides designated TGR2, TGR38, TGR18, TGR164, TGR343 and TGR358 and encoding polynucleorides. The polypeptides can be expressed by stendard DNA recombination methodology. The polypeptides are useful for screening or identifying modulators of GPCR or signal transduction. The modulators of signal transduction are useful for treating or preventing TGR-associated disorders, e.g. asthma, multiple sclerosis or kidney disease. The polypeptides are useful as targets for diagnosing or treating e.g. epilepsy, stroke, neurodegeneration, hypogonadism, hyperprolactinemia, esymptomatic urinary abnormalities, hypertension, nephrolithiasis, cirrhosis, lesions, jaundice, psoriasis, lupus erythematosus, or acute inflammatory dermatoses. The present sequence represents a human TGR343
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New G-protein coupled receptor polypeptides designated TGR2, TGR38, TGR18, TGR164, TGR343 and TGR358, useful as targets for screening drugs for treating or preventing e.g. asthma, multiple sclerosis, stroke or nephrolithiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40

The present invention provides the protein and coding sequences of several human G-protein coupled receptors (GPCRs). These can be used in the identification of candidate compounds as receptor agonists or inverse agonists having applicability as therapeutic agents. The present sequence is a GPCR coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                      Human, G-protein coupled receptor; GPCR, hRUP28; hRUP29; hRUP30; hRUP31; hRUP31; hRUP33; hRUP34; hRUP35; hRUP36; hRUP37; gene; ss.

 Expressed sequence tags of the PFI-021 sequence are mainly found in cDNA libraries from peripheral blood mononuclear cells. Two ESTS have been identified in libraries derived from breast mRNA. PFI-021 and the corresponding cDNA are used to treat a patient needing altered activation or expression of a GPCR, such as inflammation, allergy and respiratory, neurology, psychology, urogenital disease, reproductive and sexual dysfunction/disorders, cancer, tissue repair, dermatology, skin pigmentation disorders, photoageing, frailty, osteoporosis, metabolic disease, cardiovascular disease, gastro- intestinal disease, anti-infection, sensory organ disorders, sleep disorders and hair loss

                                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of a novel human testis-originated G protein-coupled receptor protein TGR10. The sequences can be used in the development of drugs for the treatment of diseases of the central nervous system, inflammations, diseases of the critical nervous system, inflammations, diseases of the circulatory system, cancer, metabolic diseases, immunological diseases, and diseases of the gastrointestinal system. The present sequence is the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300

Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
Genbank flat file format but are available as part
of this entry's ASN.1 file.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., Phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.

This sequence bas been validated by Multiple Complete Digest fing sequence has been validated by Multiple Complete Digest fingerprinting. Comparison of the experimentally darived digest fragments with sequence-predicted fragments is given below. The electronically-digested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC small fragments below a variable cutoff (approximately 400-800 bp) are not resolved in the fingerprint and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragments are separated by dashed lines.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ALIGNMENTS

338 bp DNA linear GSS 13-DEC-2000 T. brucei sheared genomic DNA clone 372g04, forward sequence, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TRE0927/4 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.

```
Sequence Validation:
This sequence has been validated by Multiple Complete Digest
This sequence has been validated by Multiple Complete Digest
fingerprinting. Comparison of the experimentally derived digest
finagments with sequence-predicted fragments is given below.
The electronically-digested sequence consists of both insert and
vector, in order to accurately represent the entire circular BAC.
Small fragments below a variable cutoff (approximately 400-800 bp)
are not resolved in the fingerprint and hence do not appear
in the table. There are no significant remaining discrepancies
between the experimental and predicted values. Uniquely ordered
fragments are separated by dashed lines.

Sequence Quality Assessment:

This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.

All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.

Base-by-base quality values are not generally visible from the Genbank flat file format but are available as part of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SegDerMap FngrPrnt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence was finished as follows unless otherwise noted:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SeqDerMap FngrPrnt
